

Bringing Forest to the
Mainstream Economy -
institutional frameworks
and economic
instruments to reduce
deforestation: Costa Rica
1991-2001 FUNDECOR

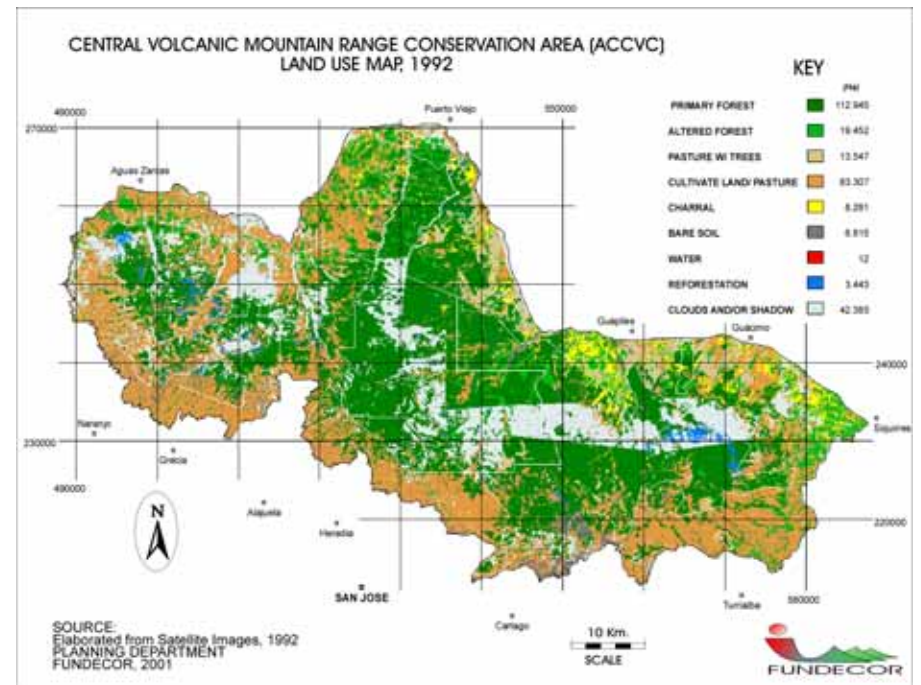

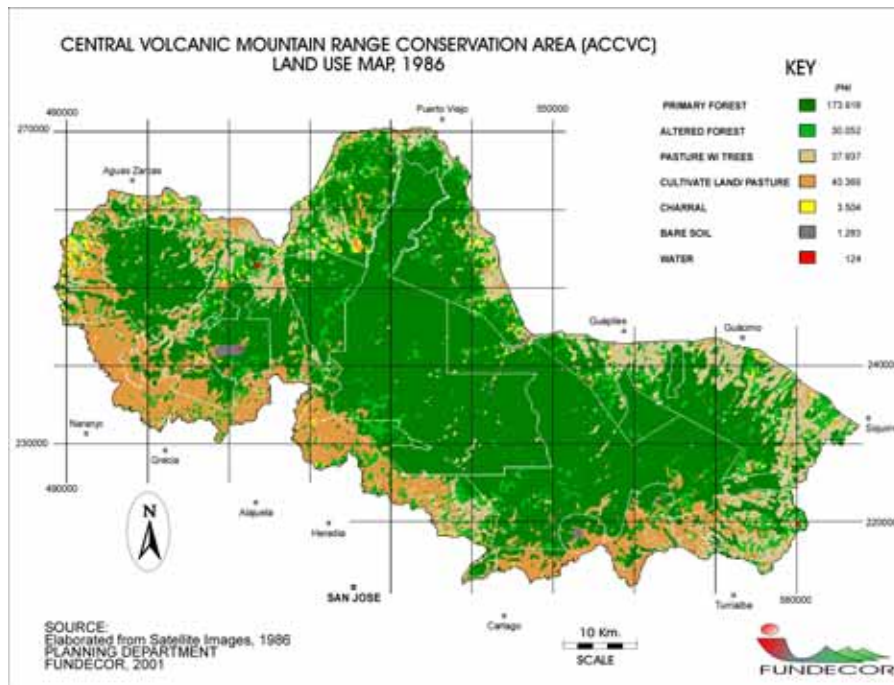

Introduction

FUNDECOR is a non-governmental organization founded in 1991 to protect and increase the Costa Rican forests located in the country's central plateau. The forest coverage of this territory is one of the largest in Costa Rica, and comprises many of the country's National Parks.

SOURCE: Tattenbach, 1999

The public and private logic of Costa Rica's environmental service payment program

- Environmental service is defined as *an environmental benefit (or cost) produced by the existence (or disappearance) of forest that is not captured by its owner, but by others*

$P \geq C$ Private Logic

$V \geq P$ Public Logic

$V \geq P \geq C$ ESP feasibility range

$V = V_g + V_c$ Disaggregating values

$V = V_c + E_g$ country logic

$V_c = O_n + V_i$ disaggregating country values

$P_t \text{ } \odot \text{ } O_n + R_i + E_g$ ESP program logic

The public and private logic of Costa Rica's environmental service payment program

- Environmental service is defined as *an environmental benefit (or cost) produced by the existence (or disappearance) of forest that is not captured by its owner, but by others*
 - $P \geq C$ *Private Logic*
 - $V \geq P$ *Public Logic*
 - $V \geq P \geq C$ *ESP feasibility range*

The public and private logic of Costa Rica's environmental service payment program

- The total value of all environmental services V is equal to the sum of the values that accrue only at the global level (V_g) and the values that accrue at the country level (V_c)

$$V = V_g + V_c \text{ disaggregating values}$$

- A country total environmental service P_c must be no more than the values that accrue at the country level plus the economic compensations obtained (exports) of the global environmental services E_g :

$$V = V_c + E_g \text{ country logic}$$

The public and private logic of Costa Rica's environmental service payment program

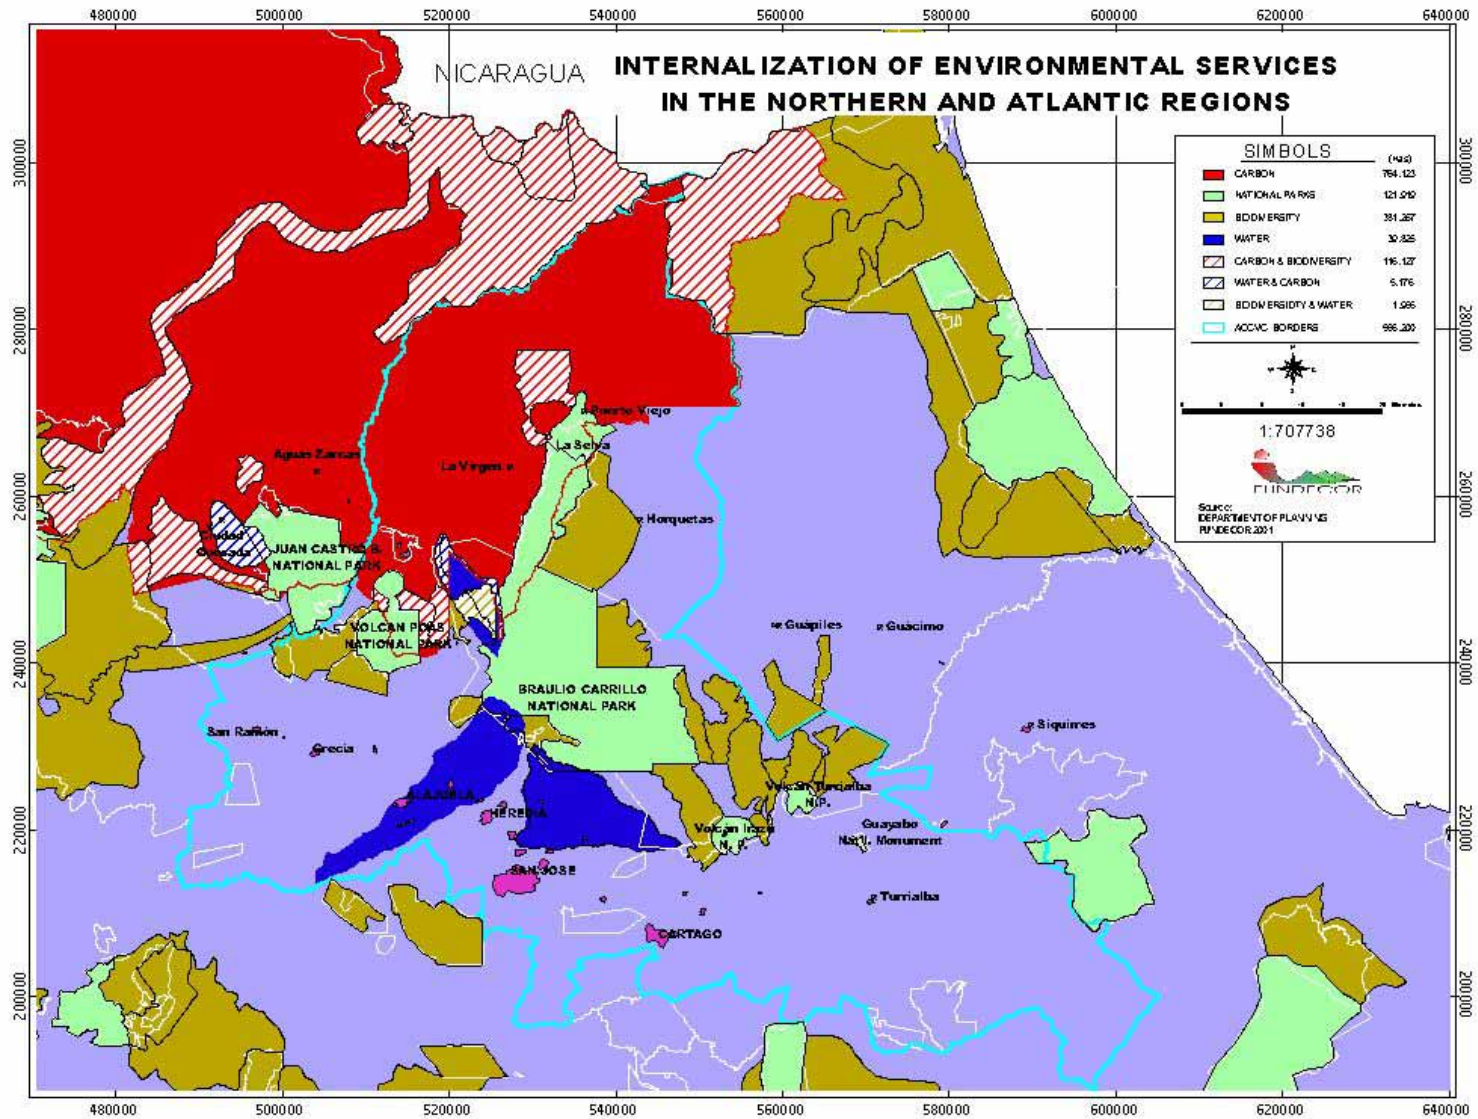

- These country values are also decomposable into values that accrue at the national level O_n and values that are only geo-specific and accrue at the local level V_i :

$$V_c = O_n + V_i \text{ disaggregating country values}$$

- A country should pay environmental service payment from general taxes P_t less than the values that accrue at the national level O_n plus the economic value revealed by the willingness to pay at the local level R_i plus the economic compensations obtained (exports) of the global environmental services E_g Eg:

$$P_t \leq O_n + R_i + E_g \text{ ESP program logic}$$

Internalization of environmental services
