Challenges for Impact Assessment Practitioners - Session 12- Output from IAIA 2014, Chile

Derek Melton, Vancouver, Canada
SUMMARY

- Introduction
- Main points:
  - Act early and think regionally
    - Ahead of individual projects
  - For individual projects
  - Equator Principles and IFC PS6
  - Biodiversity offsetting
“Wind-up” biodiversity session on last day of IAIA 2014, after many other biodiversity sessions

Over 60 attendees, session in parallel with 8 others

Five panelists, including chair, from Banks, NGOs, Industry and Consulting
MAIN POINTS - ACT EARLY AND THINK REGIONALLY

- Ahead of individual projects:
  - SEA, RAMP, etc:
    - Challenge to governments, banks, other stakeholders
    - Private sector cannot take over regional government responsibilities for a single project
  - Regional planning needs to be ecologically based
  - Unsustainable land use practices (artisanal mining) may be little regulated, while individual projects are subject to detailed biodiversity guidance
  - Paradox of more technical information but also more development in protected areas
For individual projects:

- Real analyses of alternatives, including no-project
- Baselines need to be more dynamic
- Need to better understand levels of biodiversity that represent good condition
- Is there a “way around taxonomy”?
  - Time challenges in ESIA
  - ESUs, habitat hectares, others?
- Need more effective CEA within EIAs
- Need more realistic / robust systems for adaptive management within EIA / BAP

May 30, 2014
MAIN POINTS – EQUATOR PRINCIPLES AND IFC PS6

- Provided good incentive for full use of mitigation hierarchy
- Seen as global best practice:
  - However, is it too rigid and not really designed as overarching biodiversity IA method?
- BBOP guidance on offsetting seen as main suite of guidance by many:
  - But other initiatives ongoing (CSBI, IUCN).
  - Need to ensure good sharing of experience between initiatives
MAIN POINTS – BIODIVERSITY OFFSETTING

- Need more on the ground published case study evaluations
- Need more cross fertilizations between regulated and non-regulated offsetting experience
- Crucial activities often non-technical, (offset area protection and co-management), rather than fine-tuning loss-gain calculations
- Pros and cons for how far to advance offset planning during EIA phase
- Better methods needed to demonstrate positive biodiversity outcomes from action oriented offsets
- Need clear plan for offset acquisition and funding as part of EIA
Thank you
